
The new topography of the Earth produced by TanDEM-X @ DLR

Christmas News on TanDEM-X!

TanDEM-X was launched in 2010 and has been operating together with its twin TerraSAR-X as a bistatic SAR interferometer since the beginning of 2011. The first four years were dedicated to global acquisitions using baseline geometries optimized for the required digital elevation model (DEM) performance. During this time, the Earth was covered at least twice, in difficult areas like mountainous regions or deserts up to six times. This year the processing and mosaicking of the TanDEM-X DEM was completed and it is now available for the science community and commercial users worldwide!

The picture above shows a section of the TanDEM-X DEM from Egypt to Israel.

Look out for further news on TanDEM-X at www.dlr.de/HR

The Microwaves and Radar Institute sends many Season's Greetings and wishes you a Happy New Year 2017!
