Thermal properties of storage material and heat transfer fluids

Stability, compatibility, corrosion

Heat exchanger / heat transfer enhancement

Lab-scale tests

Technical material quality

Thermophysical properties

Thermo-mechanical design

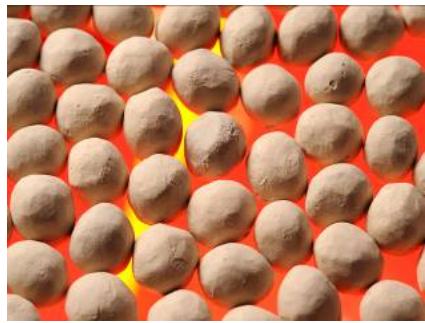

Containment, Insulation

System integration

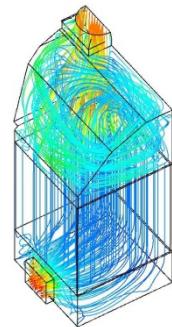

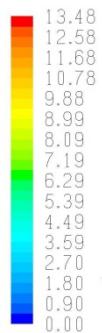

# Materials and Sub-Components for Heat Storage

Storage material

*Water, natural rocks,  
ceramics, concrete  
salts, metal oxides*

Heat transfer fluid

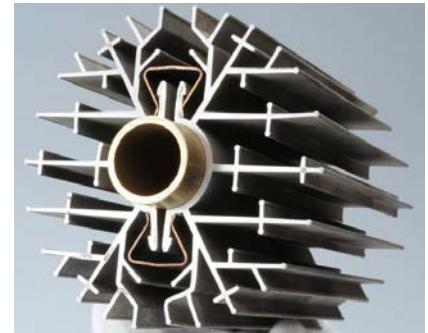

*Air, flue gas,  
water/steam, molten  
salt, thermal oil*

Container

*Pressurized vessels,  
packed bed designs,  
corrosive media*

Heat exchanger

*Finned tubes,  
shell-and-tube heat  
exchanger*

Additional components: pumps, valves, connection pipes, insolation,  
foundation, instrumentation and control devices

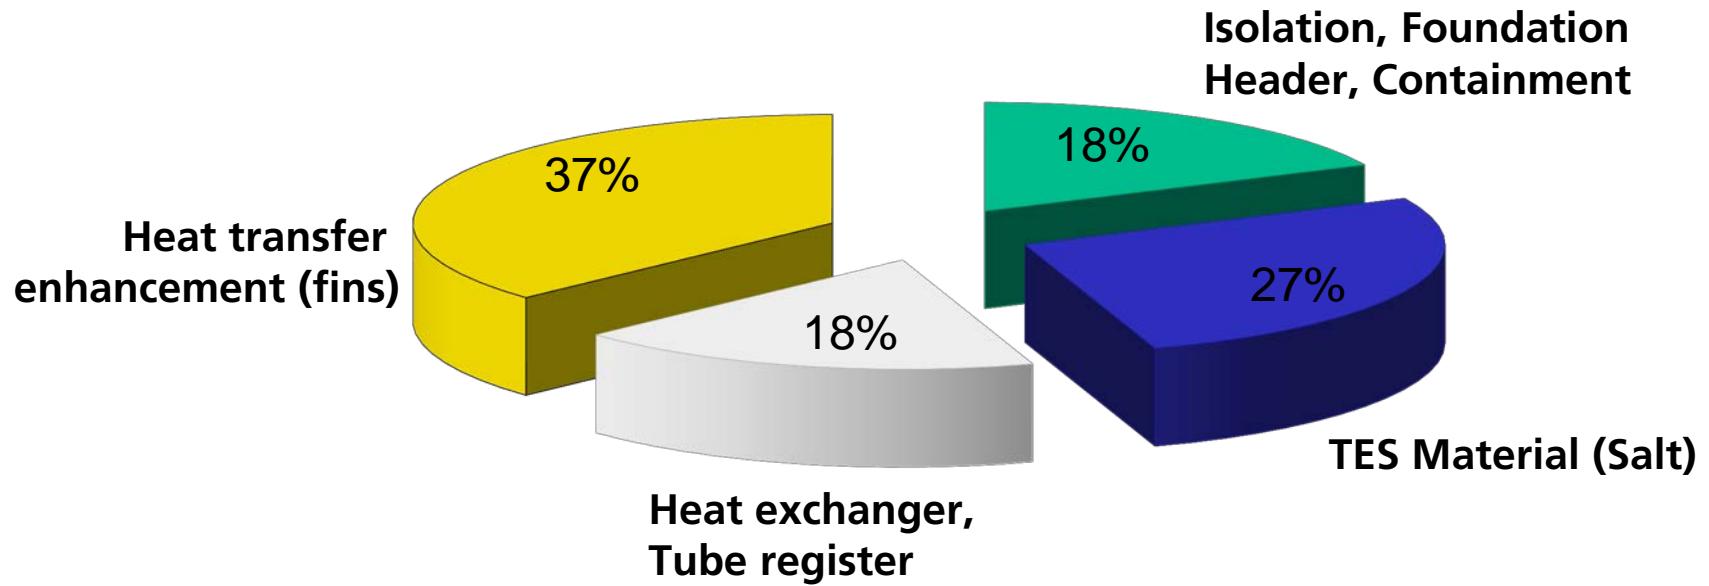

**Take away: TES requires more than  
storage material research**

# Impact of Specific Material Categories

## Example: PCM storage with Nitrate Salts

Operated with water/steam HTF

# High-Temperature TES materials and technologies

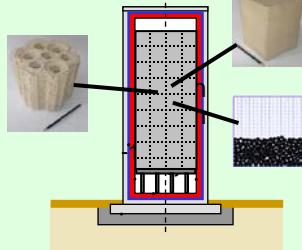

## Sensible heat

### Solids

Concrete

Ceramics and rocks

### Liquids

Molten salt

Pressurized water

### Mixture of solids and liquids

## Latent heat

### Phase change

Solid-solid

Solid-liquid

Alkali nitrate/  
nitrite salts

## Chemical heat

### Reactions

Gas-gas

Liquid-gas (Absorption)

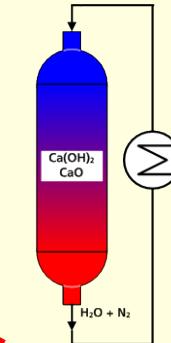

Solid-gas

$\text{Ca}(\text{OH})_2/\text{CaO}/\text{H}_2\text{O}$

$\text{CaCl}_2/\text{H}_2\text{O}$

$\text{Mn}_2\text{O}_3/\text{Mn}_3\text{O}_4/\text{O}_2$

$\text{H}_2\text{O} + \text{N}_2$

# Molten Salt Storage

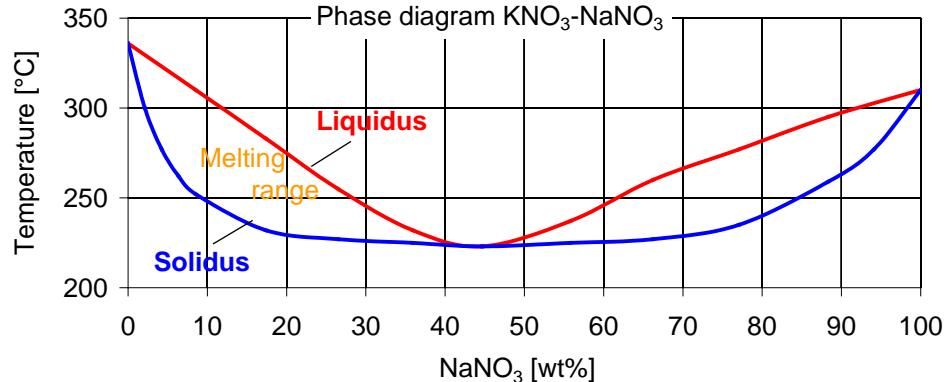

- Market status: Commercial CSP experience
  - 2-tank indirect concept, max. 390 °C (Andasol, 2009)
  - 2-tank direct concept, max. 560 °C (Gemasolar, 2011)
- Technology:
  - Decoupled thermal power and capacity; constant power
  - Boundaries set by current storage medium (temperature levels, costs)
- Research focus/challenges:
  - Development of alternative salt systems
    - Lower melting temperature to avoid freezing (< 140 °C)
    - Stability at higher temperatures (up to 700 °C)
  - Cost reduction – alternative tank design (e.g. Thermocline – single tank with filler)
  - Components and materials for higher temperatures

# Molten Salt Storage – Phase diagrams

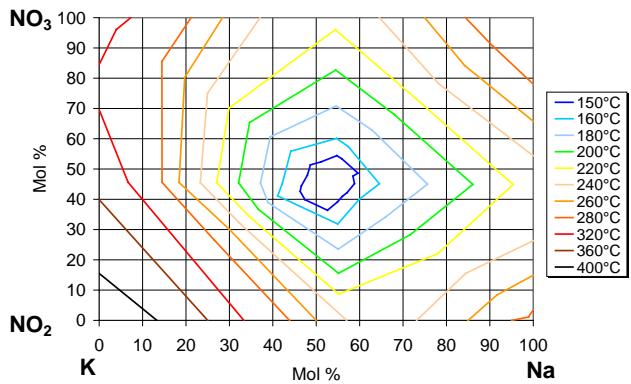

*3 different Ions,  
Binary system with common ion*

*4 Ions,  
Additive  
Ternary*

*4 Ions,  
Reciprocal  
Ternary*

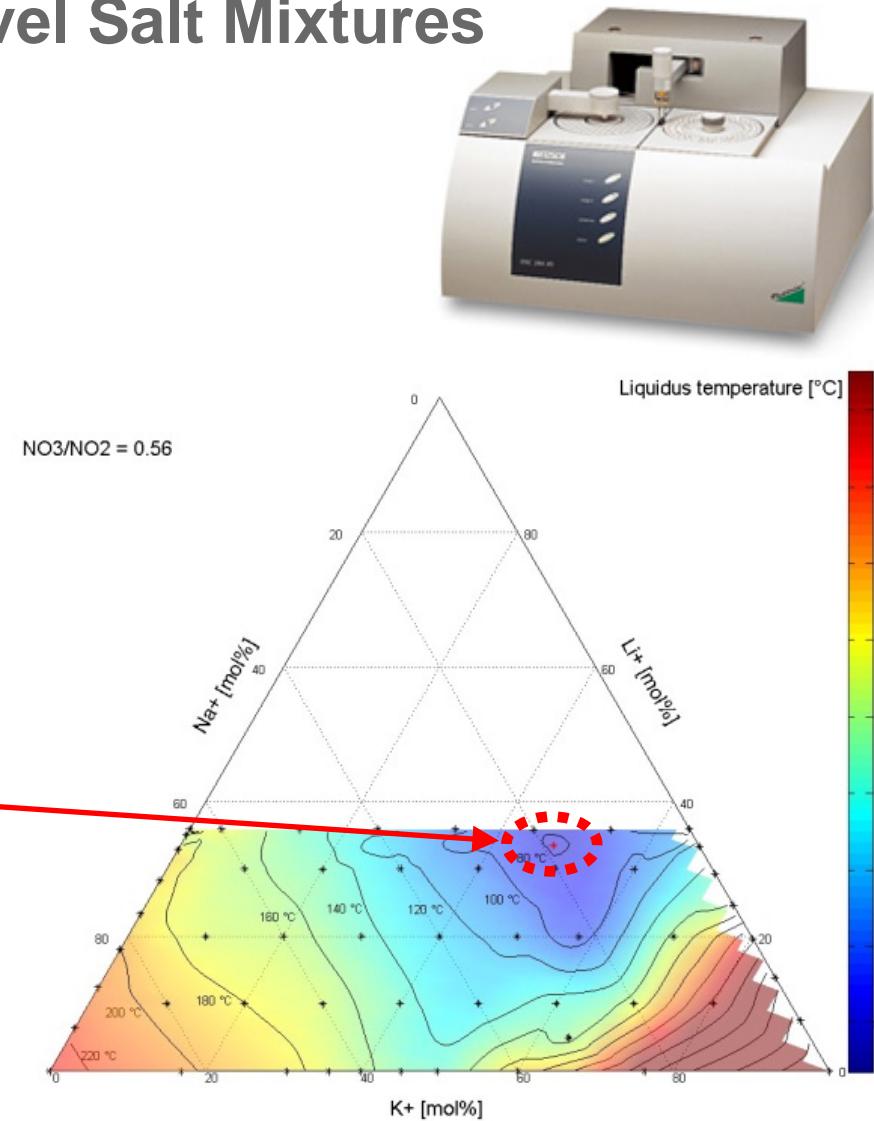

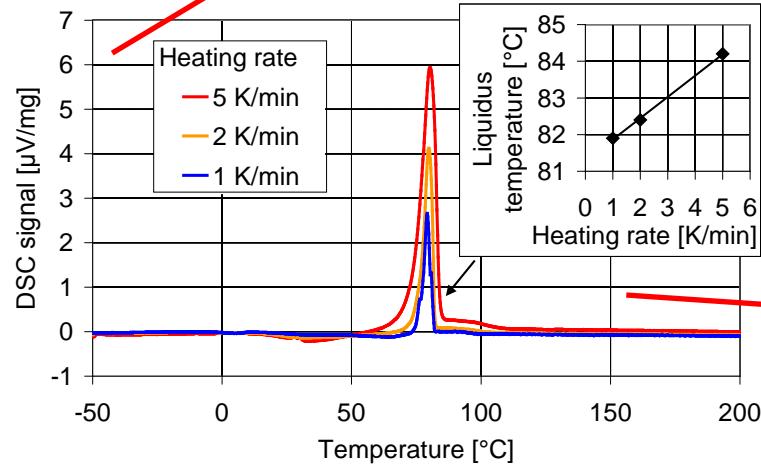

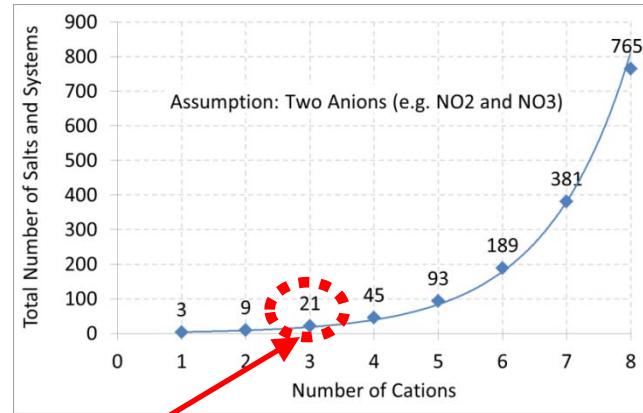

*5 Ions, Additive Quaternary  
(e.g. KNO<sub>3</sub>-NaNO<sub>3</sub>-LiNO<sub>3</sub>-Ca(NO<sub>3</sub>)<sub>2</sub>)*

*5 Ions, Reciprocal Quaternary  
(e.g. Li, Na, K // NO<sub>2</sub>, NO<sub>3</sub>, T<sub>min</sub> ≈ 80 °C)*

# Molten Salt Storage – Novel Salt Mixtures

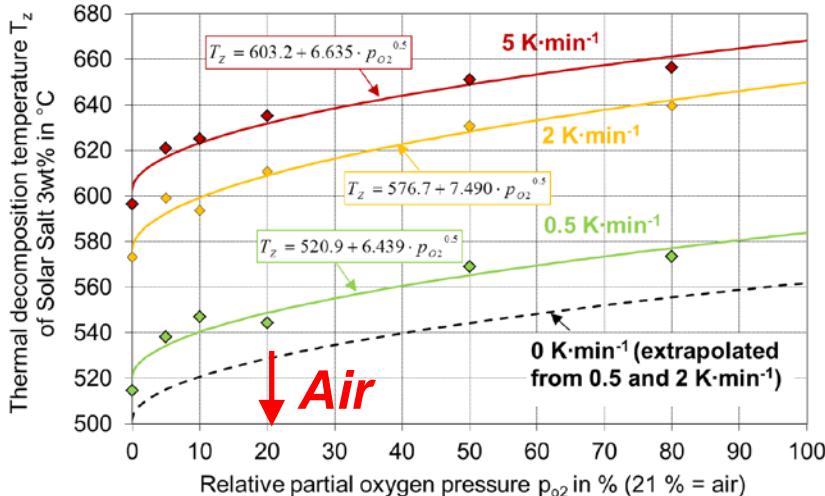

**Take away: Low melting temperature alkali nitrate/nitrite mixtures are feasible**

$\text{Na NO}_3$

Cation Anion

# Molten Salt Storage – Solar Salt Stability

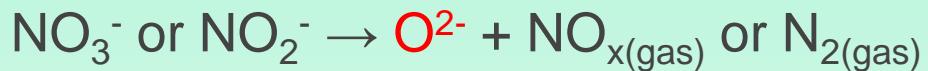

**Take away: Stability of nitrate salts depends on several parameters**

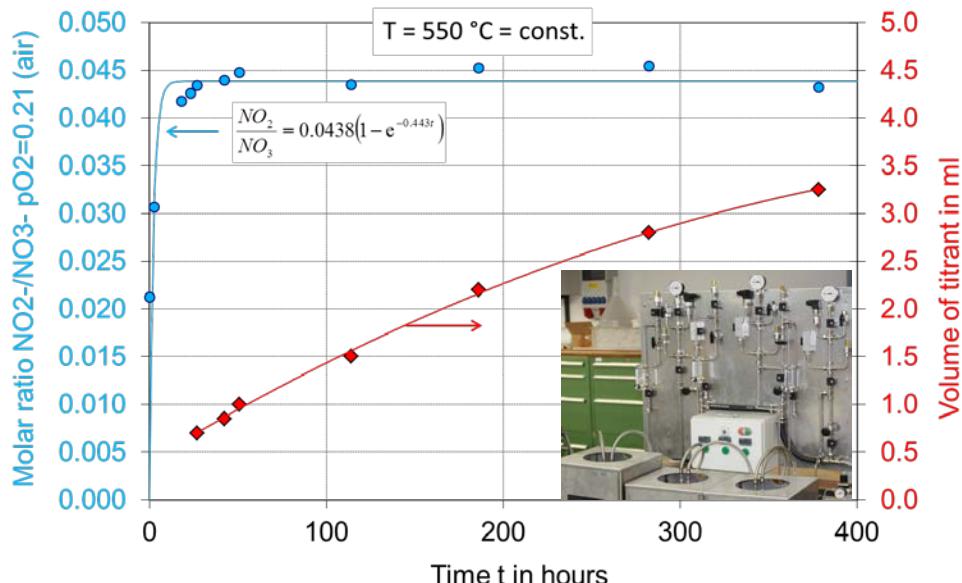

**First decomposition reaction:**

**Second decomposition reaction:**

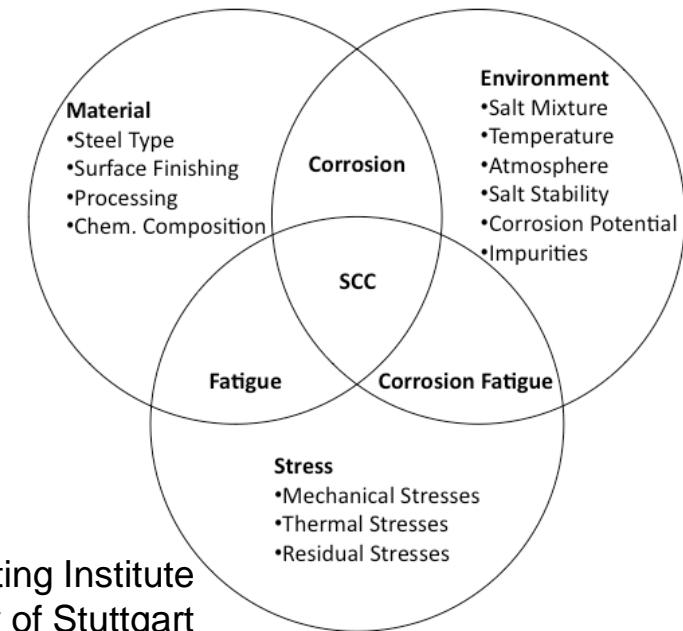

**Other Side reactions with  $\text{CO}_2$  and  $\text{H}_2\text{O}$**

# Molten Salt Storage – Steel Corrosion with Nitrates

- Major structural alloys:
  - Low alloyed carbon steel ( $\leq 400^\circ \text{ C}$ )
  - Cr-Mo steel ( $\leq 500^\circ \text{ C}$ ) (Cr-content up to about 9 wt%)
  - Stainless Cr-Ni steel ( $\leq 570^\circ \text{ C}$ ) (with/without Mo, Nb, Ti alloying)
  - Ni-alloys ( $\leq 650^\circ \text{ C}$ ) (i.e. Alloy 800)
- Corrosion aspects:
  - Nitrate salt impurities (e.g., chlorides)
  - Nitrate salt decomposition products
  - Solubility of chromium from oxide layer
  - Stress corrosion cracking (SCC)

Source: Materials Testing Institute  
(MPA), University of Stuttgart

# Molten Salt Test Facility “Tesis”

- Technical figures:
  - 20 m<sup>3</sup> Solar Salt  
(60 wt% NaNO<sub>3</sub> and 40 wt% KNO<sub>3</sub>)
  - Temperature range 250 to 560 ° C
  - Mass flow rate up to 8 kg/s
- Research focus/challenges:
  - Molten salt storage concepts  
(e.g. single tank / thermocline)
  - Component tests  
(e.g. pumps, valves, receiver tubes,  
measurement & control)  
→ industrial partners
  - Operational molten salt aspects

# Thermo-chemical Heat Storage

- DLR Development status: Lab-test rigs
  - $\text{Ca(OH)}_2 / \text{CaO}$  (300 – 700 ° C)
  - Salt hydrates, reference  $\text{CaCl}_2$  (up to 200 ° C)
  - Metal oxides (up to 1000 ° C)
- Target applications: CSP, industrial heat recovery
- Technology:
  - Reversible Gas-Solid Reactions
  - High storage density
  - Loss-free and long-term storage feasible
  - Heat transformation possible
- Research focus/challenges:
  - Characterization of suitable material system
  - Complexity of heat and mass transfer with chemical reaction
  - Reactor designs
  - Separation of thermal power and capacity (movement of the reaction bed)

# Thermochemical $\text{Ca(OH)}_2/\text{CaO}$ storage

- Target applications:
  - CSP, industrial process heat
  - Temperatures 300 – 700 ° C
- Technology
  - $\text{Ca(OH)}_2 + \Delta H \leftrightarrow \text{CaO} + \text{H}_2\text{O}$
  - Direct/indirect contact concepts
- Start of larger test rig in progress
- Research focus/challenges
  - Up-scaling of reactor design
  - Movement of the reaction bed
  - System modeling and process integration

# Summary and Conclusions

- Molten salt TES technology
  - Several parameters affect nitrate salt stability → no single limit
  - Tower systems require novel salts with stabilities up to 700 ° C
  - Parabolic trough systems require salts as fluids with a liquidus temperature as low as possible to avoid freezing
- Thermochemical TES technology offers unique advantages  
→ Storage of educts/products at room temperature, heat transformation
- Diversity of fluids and storage materials in the high temperature range  
→ Molten salt is **one** TES option among several others
- TES material development not only refers to improved storage materials, but also to material aspects in other components (e.g., containment)

Thank you for your attention !
